

— INDUSTRY REPORT • VOL 01

Spring Boot Developer Productivity

Benchmarks for build time, test coverage, and deployment frequency across real teams.

100+ teams surveyed · anonymized · segmented by team size and industry

PragmaTech
First edition
pragmatech.digital

A first honest benchmark of how Spring Boot teams actually ship.

How long does a Spring Boot build really take in 2026? How much of your code is actually covered by tests? How often does the average team ship to production? This report turns first-hand answers from 100+ engineering teams into honest, comparable benchmarks — so you can see where your team stands, and where the rest of the industry is heading.

Methodology

TEAMS SURVEYED	112
COUNTRIES REPRESENTED	24
SURVEY WINDOW	Jan – Mar 2026
ANONYMISATION	Per-response, no PII retained

Contents

01	Cover
02	About this report
03	Build times
04	Test coverage
05	Deployment frequency & next steps

MEDIAN BUILD TIME

4m 20s

+18% vs. last informal benchmarks

MEDIAN LINE COVERAGE

67%

Most teams sit between 55–80%

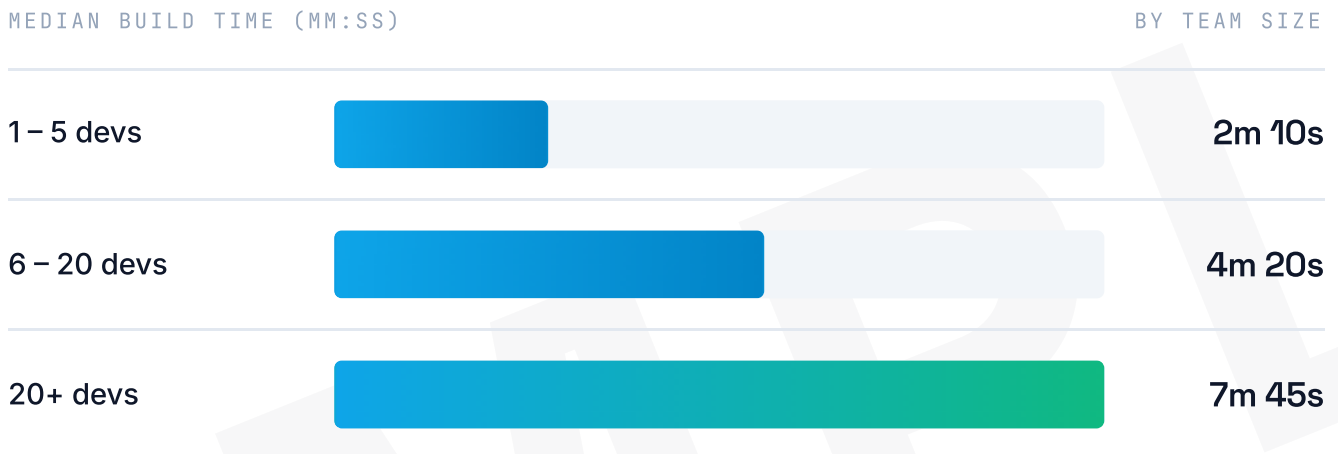

MEDIAN DEPLOY FREQUENCY

Weekly

Only 14% deploy on demand

Build times scale faster than teams do

We asked teams for the median wall-clock time of a clean `./mvnw verify` (or Gradle equivalent) on the developer machine they use day-to-day. Larger teams report meaningfully longer builds — driven mostly by test-suite weight, not compilation.

The 3.6× rule

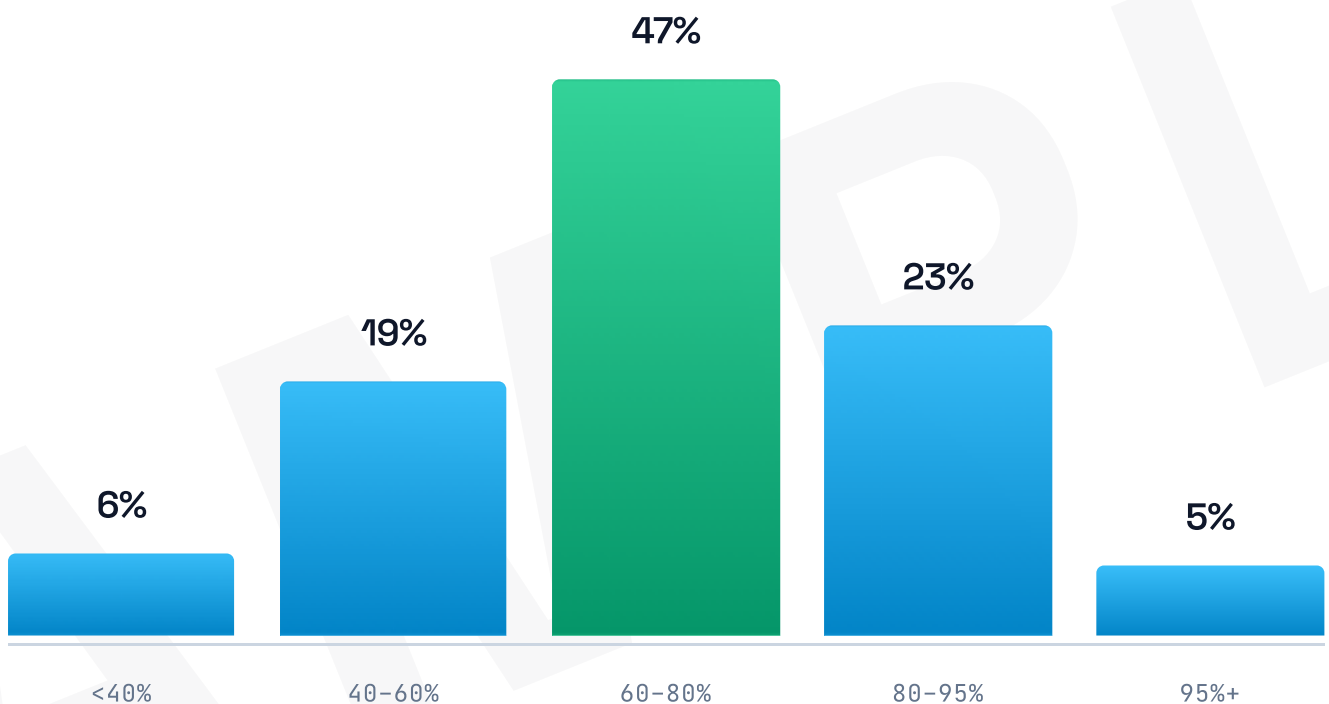

On average, teams of 20+ developers wait 3.6× longer for a green build than 1–5 dev teams. Most of the gap is test execution: 71% of the larger teams report integration tests as the dominant slice of build time.

Test coverage clusters around 'good enough'

Line coverage, self-reported from each team's primary Spring Boot service. The distribution is sharply peaked: most teams have decided 60–80% is the right operating point and stopped optimising.

SHARE OF TEAMS (%)

SELF-REPORTED LINE COVERAGE

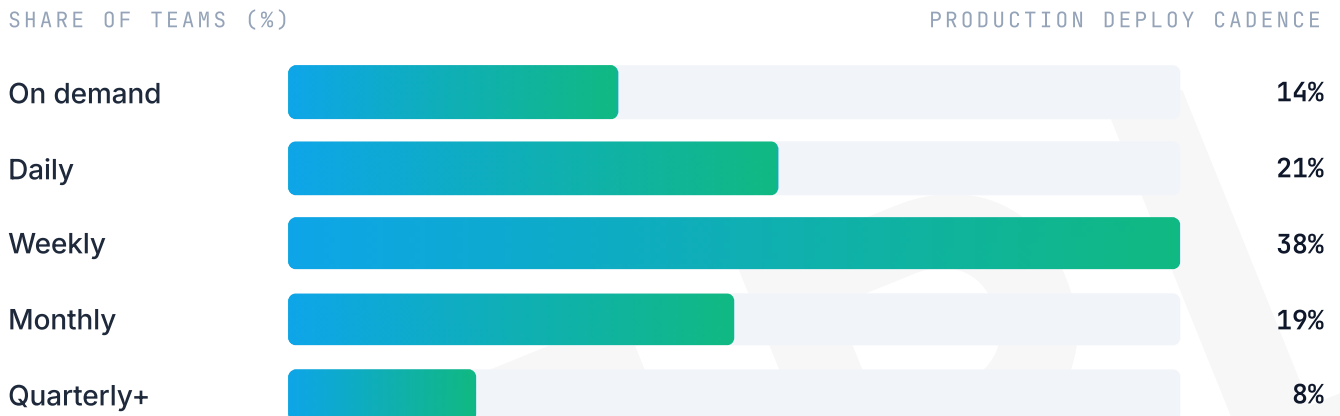

“

We stopped chasing coverage at 75%. The last 20% would have taken longer to write than the entire previous year of features.

— STAFF ENGINEER, FINTECH, 50-PERSON TEAM

Most teams ship weekly — very few ship on demand

Production deployment cadence for the team's primary service. 'On demand' means a developer can deploy any commit, any time, with no batch boundary.

What's next

The full 2026 report will include segmentation by industry (finance, e-commerce, public sector, SaaS), team age, and CI provider — plus the open-ended answers from teams that have measurably moved from monthly to weekly cadence inside the past 12 months.

Want to contribute next year's data?

Take the 2027 survey (~4 minutes, fully anonymous) and you'll receive the next report the moment it ships.
